## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claim 1 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ryberg.

The patent by Ryberg (5,441,025) shows a fuel cut-off device for an engine. A normally-opened type solenoid valve is adapted to block a fuel passage in a carburetor during energization of the solenoid valve. An engine control switch is adapted to be operated to a turned-off position in which an engine ignition device is brought into an inoperative state, and a turned-on position in which the engine ignition device is brought into an operative state. Output is supplied to the solenoid valve in the turned-off position of the engine control switch.

The patent by Ryberg does not specifically show that the source of electricity comes from a generator, however it is the view of the examiner that the source of electricity is a choice of design. It is well known in the art to supply solenoids with energy from either a generator or a battery depending requirements of the engine. Because the source of energy is not specifically detailed, the patent by Ryberg also does not show that the source of energy is supplied to an electric load when in the turned-on position. It is inherent that the source of energy is supplied to an electric load when in the turned-on position.
